

COLLAPSIBLE CONTAINER WITH INTEGRALLY SUPPORTED

DUNNAGE

Abstract of the Disclosure

A reusable and returnable container for holding product therein during shipment and then being returned for reuse comprises a body having at least two opposing and moveable side structures, which are configured for being selectively moved into an erected position for shipment and moved into a collapsed position for reducing the size of the container for return. A dunnage structure spans between the side structures and is operably coupled to the side structures for moving to an erected position for receiving product when the side structures are erected and moving to a collapsed position in the body when the side structures are collapsed so that the dunnage remains with the container when returned. The dunnage structure has an open end facing at least one side structure of the body, and the side structure defines an open area which is in alignment with the dunnage structure open end for accessing the dunnage structure and transferring product into and out of the dunnage structure from a side of the container.
